Observation Objective					
	17EUSURFAC01: We will observe Europa's surface at various longitudes and phase angles with TMC on to get good signal using F/F full scans. These observations will complement the nominal mission observations to derive phase curves for several locations on Europa, to understand how exogenic processes affect the surface scattering. We are interested in obtaining a high signal-to-noise at the shorter wavelengths (< 2200 Å) to see if Europa's surface has any distinctive features in this region. Observe Europa's surface at ~1 hour. Sunlight, 160° longitude, 75° phase.				
	Rj = 14.7 UVS configuration: full F/F scans				
	MBTG = 17712 bits/flush * 1 flush = 0.018

Observation Objective					
		<p>17IUPELEPLM1: UVS observations of Io have been very successful in identifying regions of relatively thick sulfur dioxide gas associated with volcanic plumes, both those detected by SSI and probable "stealth plumes". These thick regions have been identified by a distinctive feature in the UVS spectral range which has not previously been used by HST; our observation will greatly enhance our understanding of Io's volcanoes and atmosphere. The E17 orbit presents an excellent opportunity to observe the Pele region since the UVS will not participate in the I24 observation due to the high radiation environment during those close-up observations. Lat/lon = 0/255.</p>
