

Advances in understanding 3D interactions between sunlight and the atmosphere during the SORCE mission

Tamás Várnai
UMBC JCET, NASA GSFC

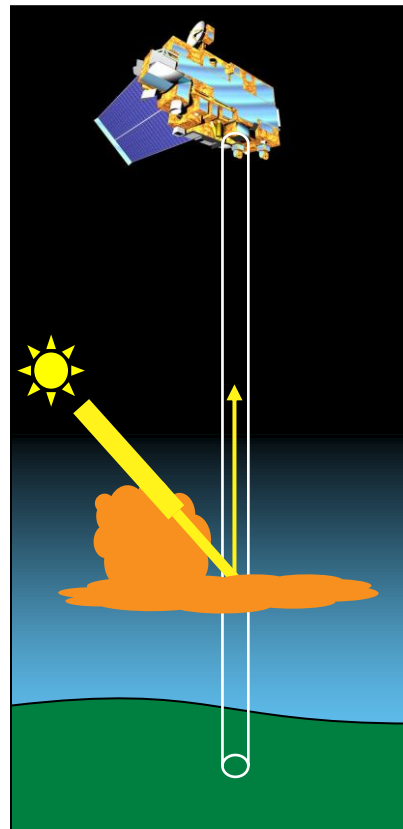

3D radiative effects in the atmosphere

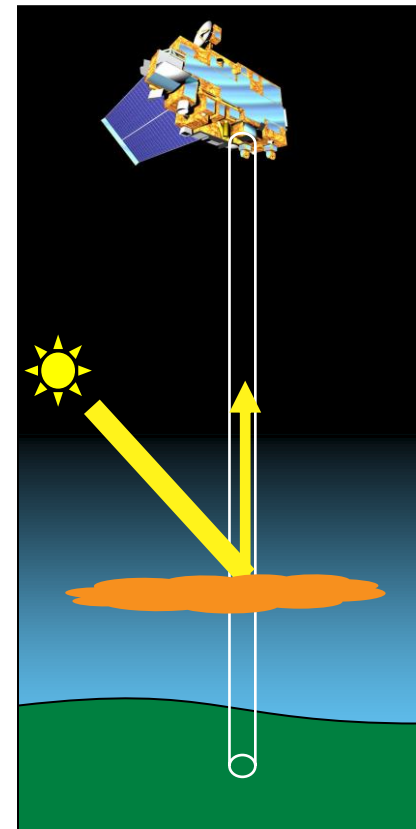

1D approximation:

$$\nabla = \frac{\partial}{\partial x} + \frac{\partial}{\partial y} + \frac{\partial}{\partial z} \approx \frac{\partial}{\partial x}$$

3D world

1D approximation

Steps toward 3D radiation in applications

Estimate the impacts of 1D approximation

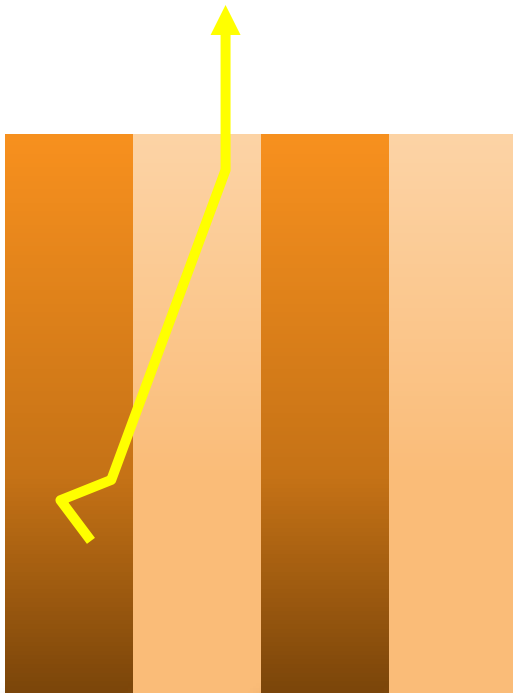

Mitigate the impacts
(3D corrections or fully 3D calculations)

Develop remote sensing methods that gain
new information from 3D radiative processes

Understanding impacts of 1D approx. in 3D world

Channeling (Cannon 1970)

Improvements in 3D simulations:

Speed, polarization

Intercomparison of 3D Radiation Codes

(Online 3D calculator, public code, reference results, book)

Impacts on deep convective clouds

Modest immediate impact on development of deep convective clouds
(O'Hirok, Frame, Cole)

Cloud water and ice

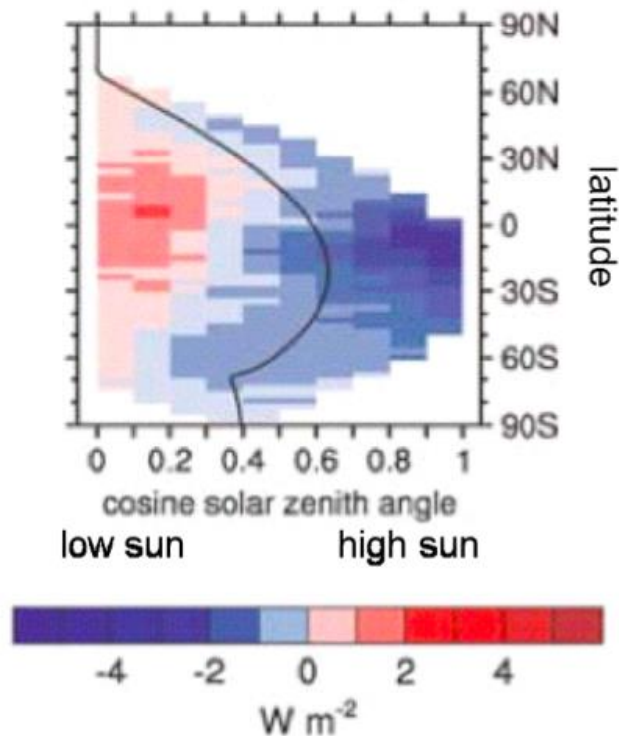

Solar heating

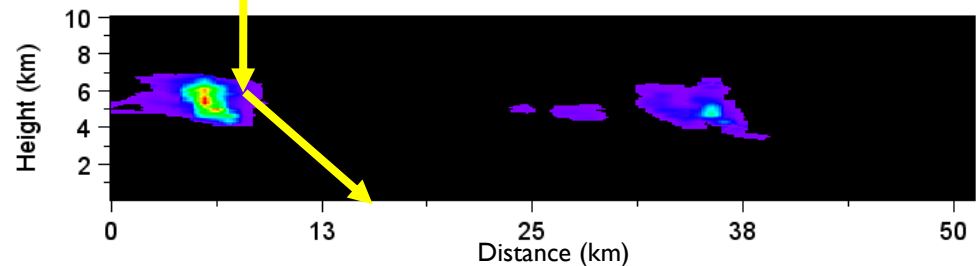

Impacts on large-scale solar heating

All clouds in a monthlong global
4 km-resolution simulation

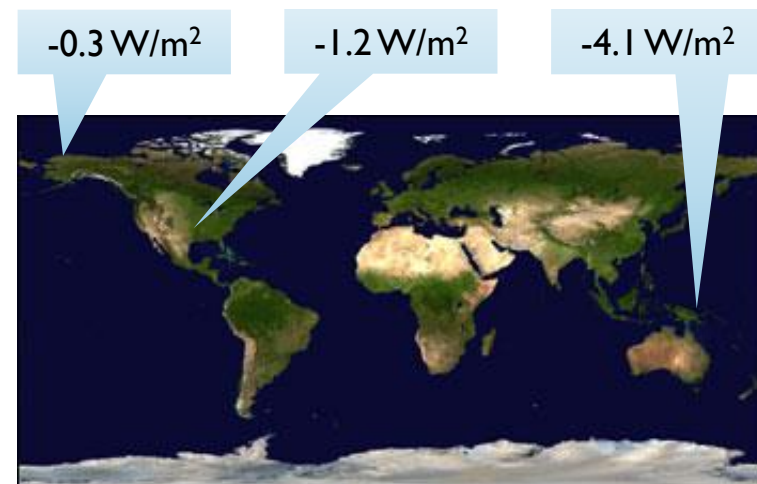

2-D - 1-D difference in
TOA upward flux

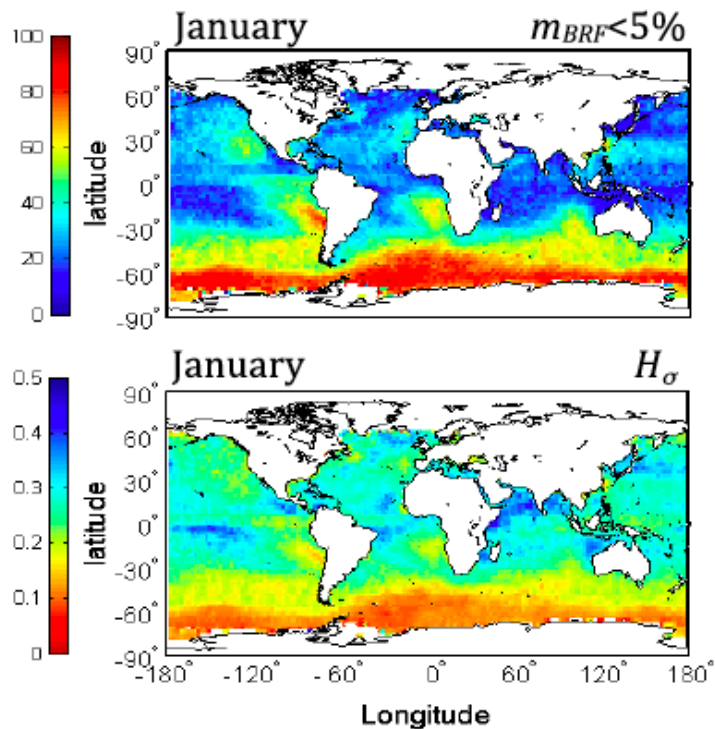

Radar measurements of cloud water
content at DOE sites

Multiyear full-day (24 hour) average difference between
2D and 1D calculations of reflected sunlight

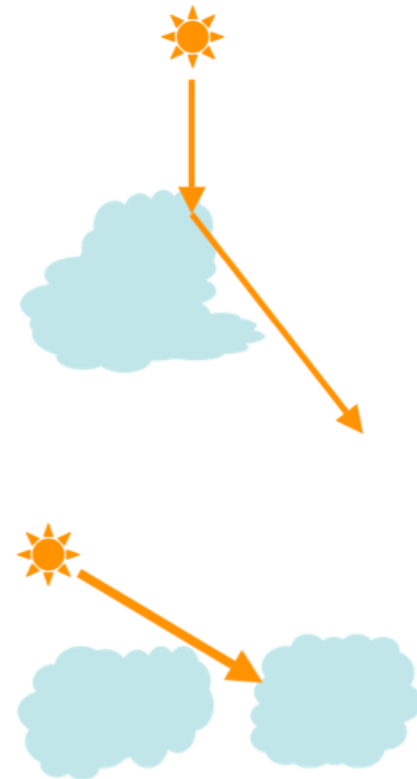

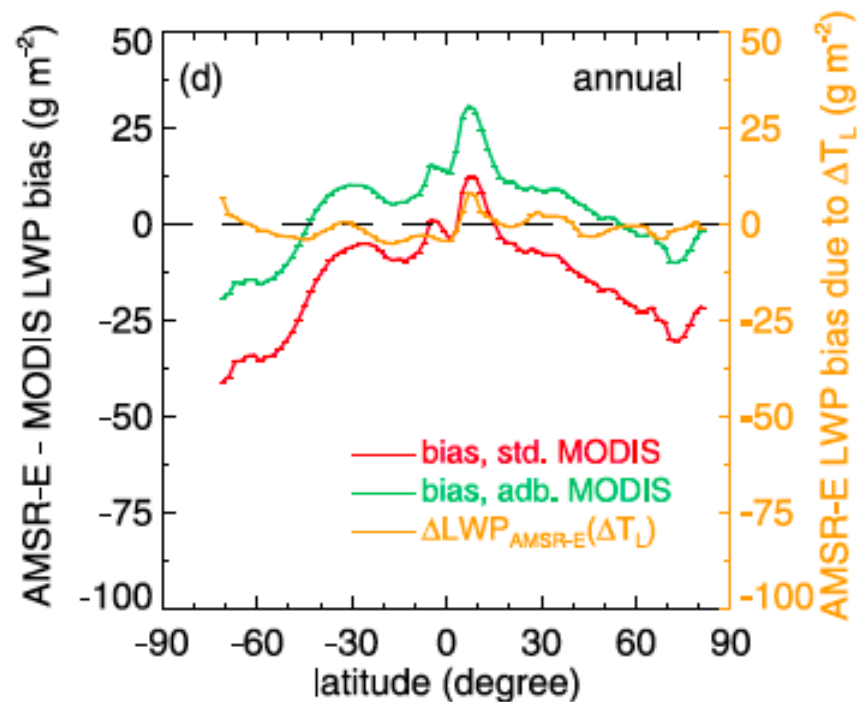

Impacts in cloud remote sensing

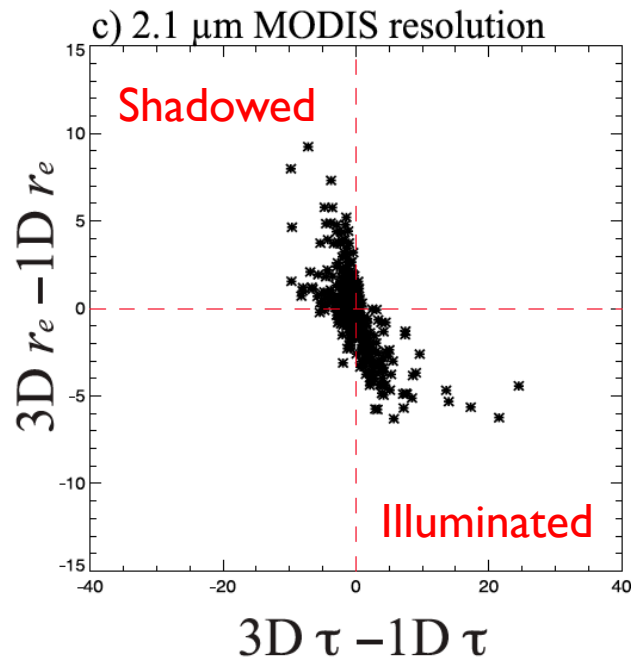

How frequently the observed view-angle dependence of reflected sunlight matches ID calculations?

How big are the brightness-differences between neighboring pixels?

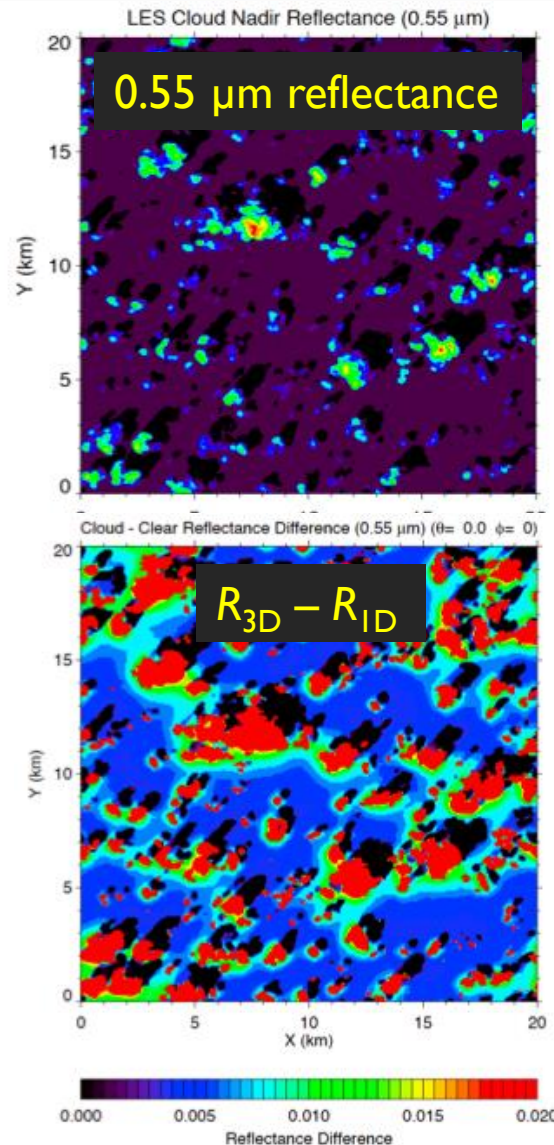

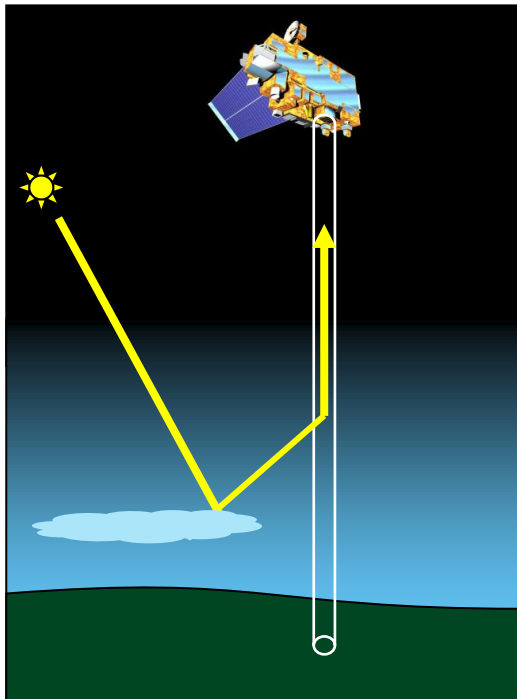

Impacts in cloud remote sensing: water content

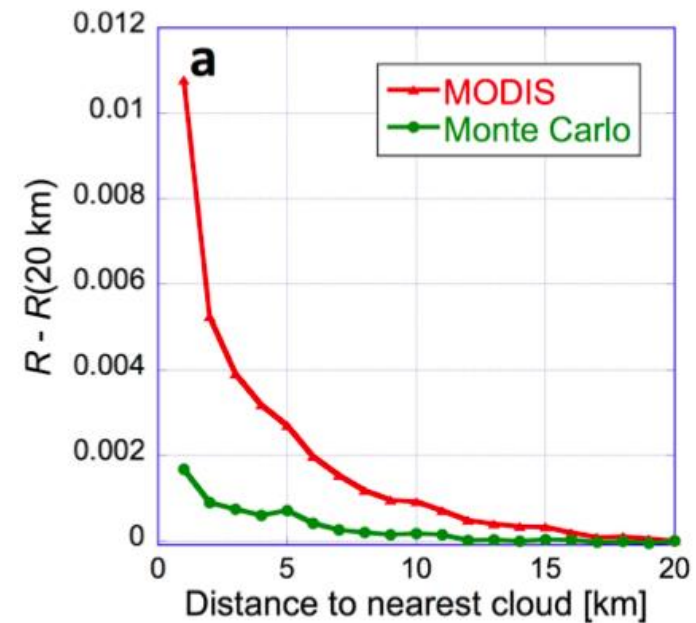

Impacts in cloud remote sensing: droplet size

Impacts in aerosol remote sensing

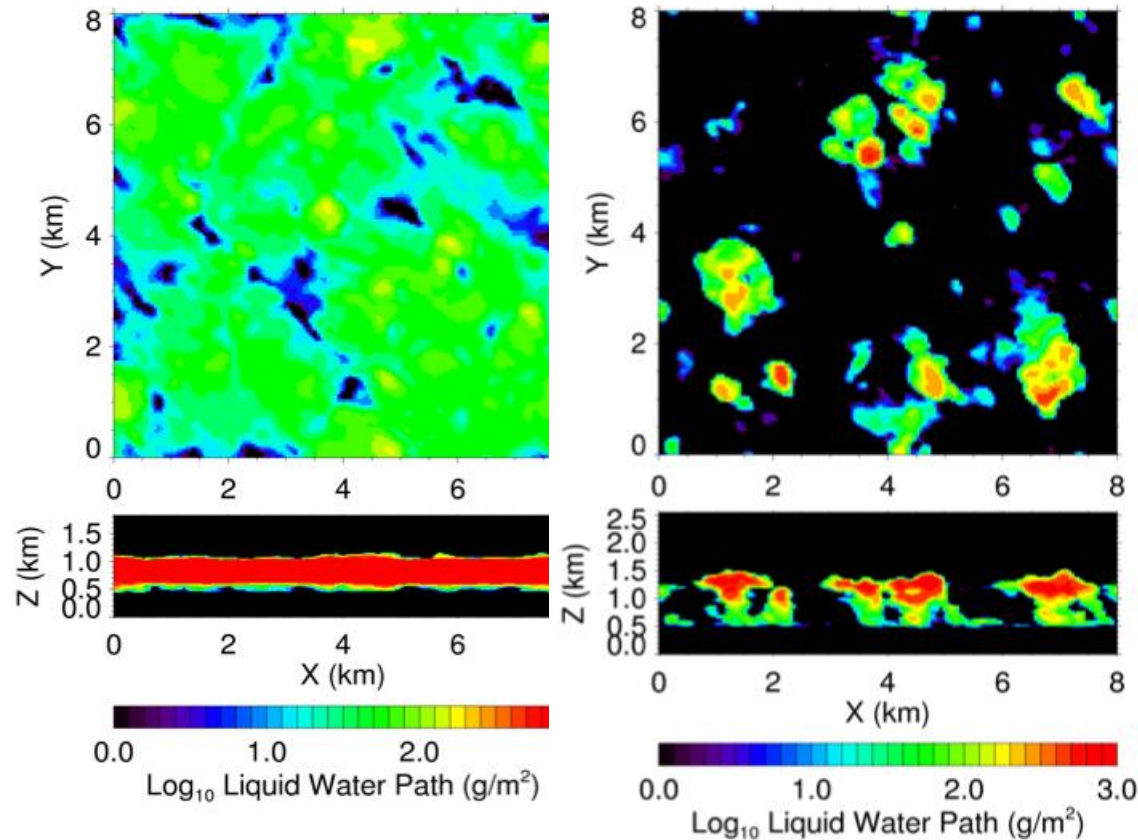

Global yearlong dataset

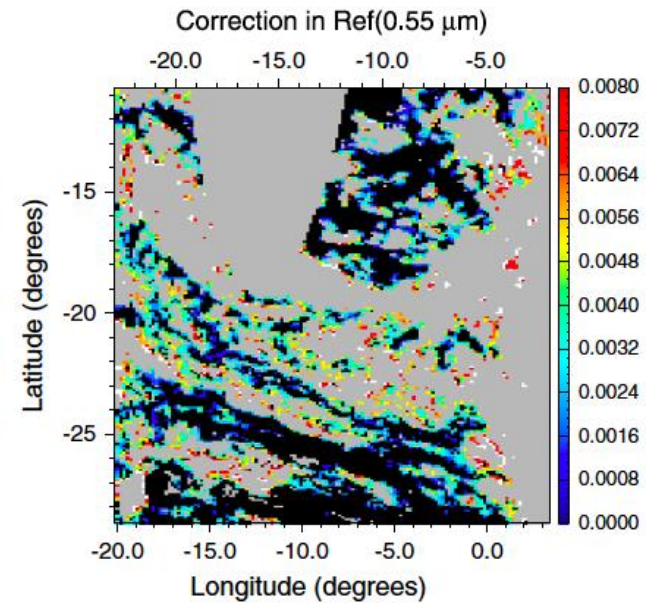

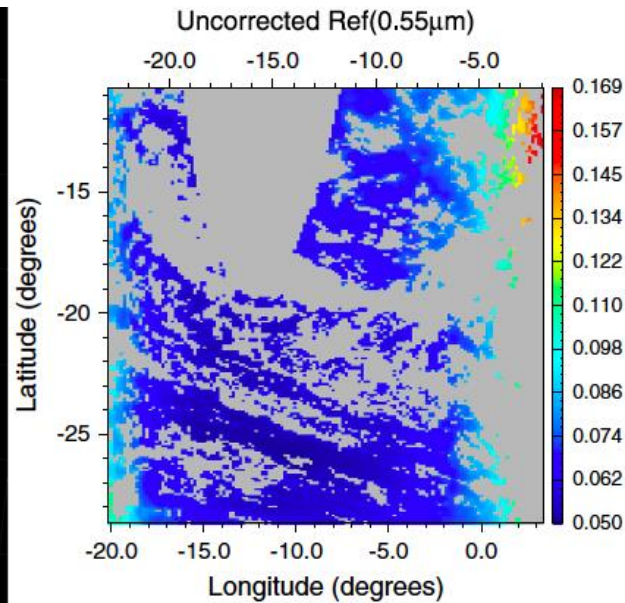

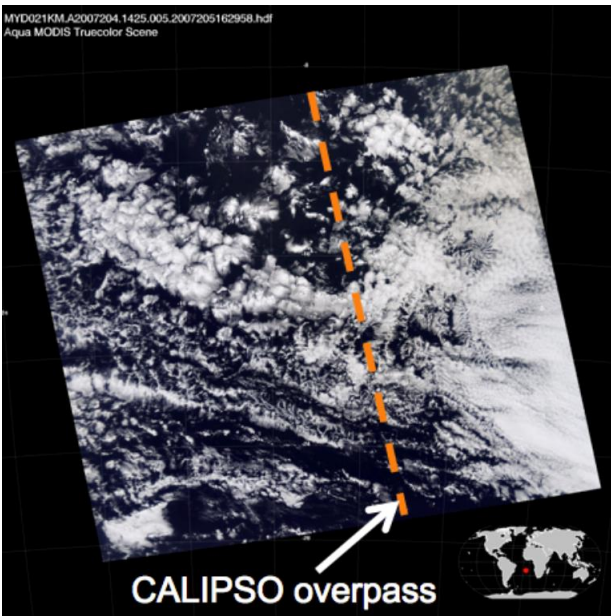

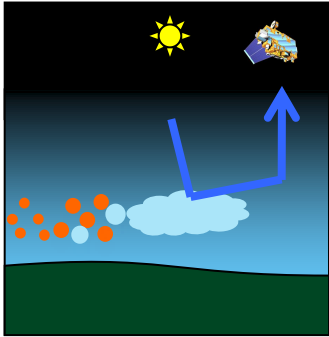

Mitigating 3D impacts: cloud remote sensing

Two sample scenes out of 1000
from dynamical simulations

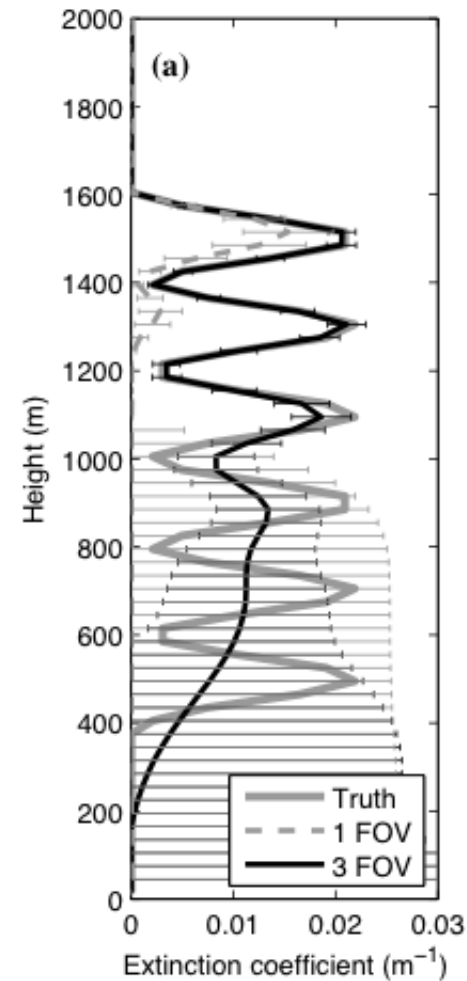

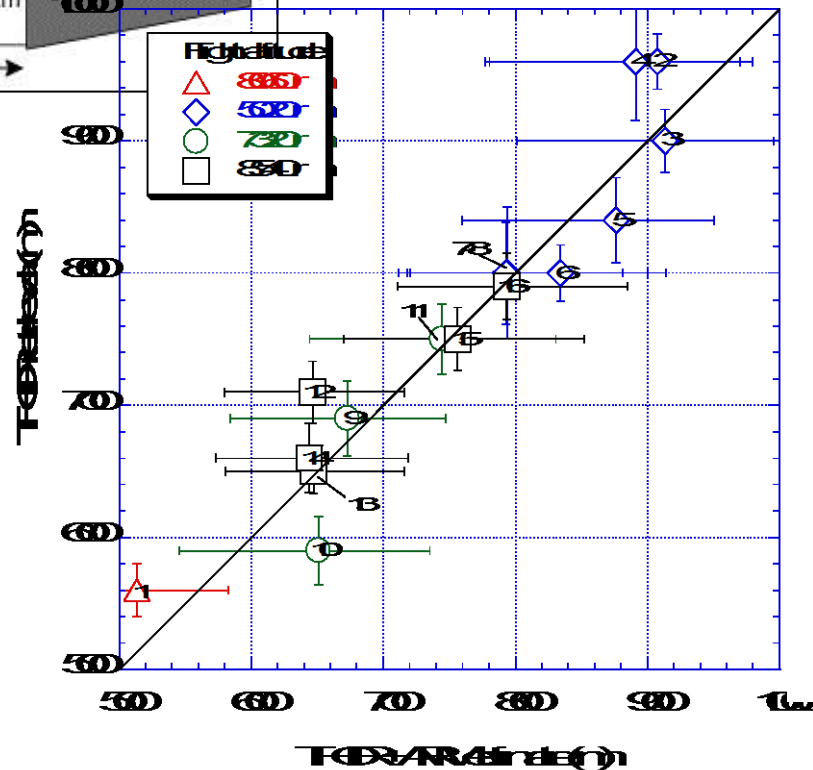

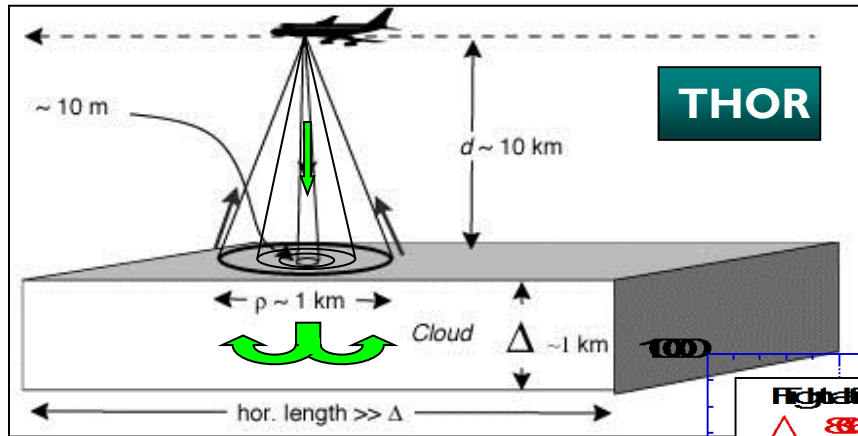

Neural net reduces errors of ID retrievals by half or even two-thirds by using multiple views and texture

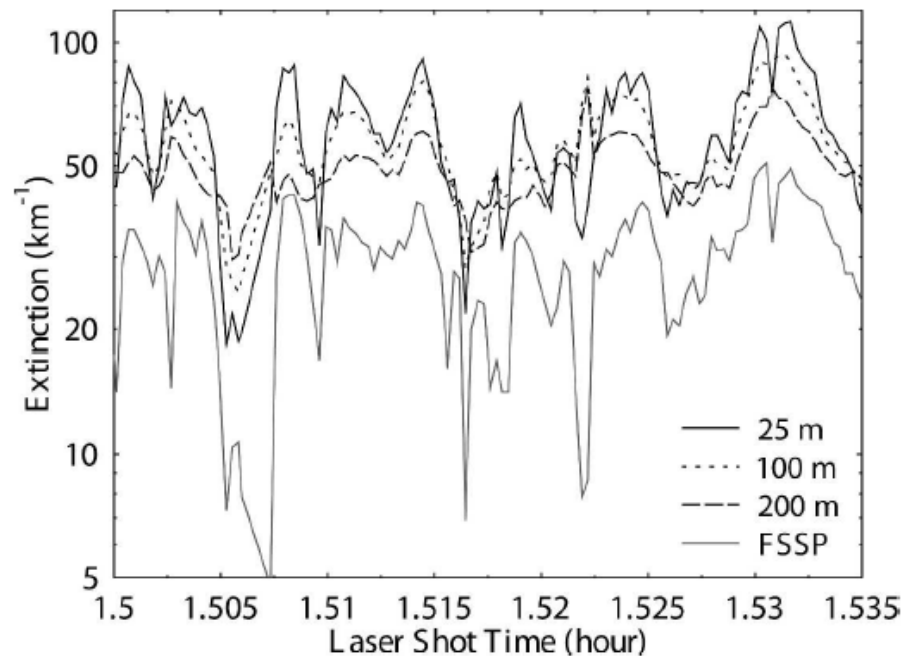

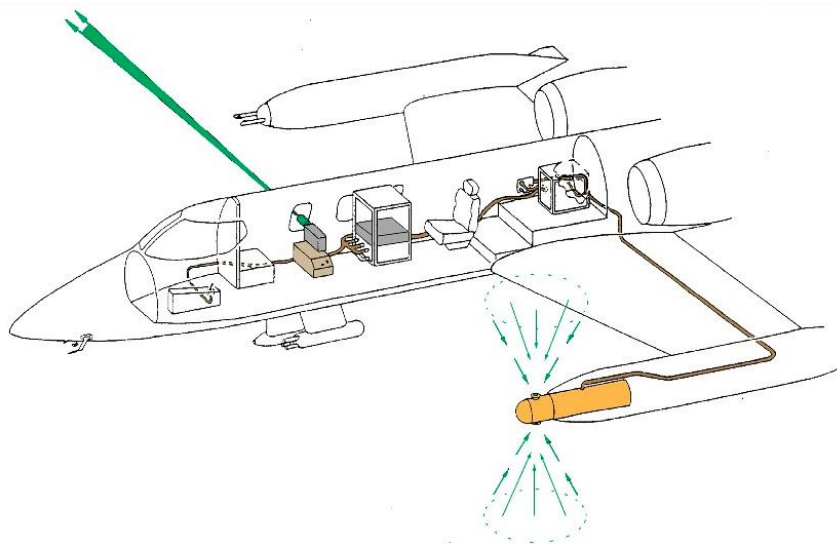

Mitigating 3D impacts: aerosol remote sensing

Taking advantage of 3D radiative processes

Taking advantage of 3D processes

Next step: 3D in operational data processing

EarthCARE (launch around 2016)

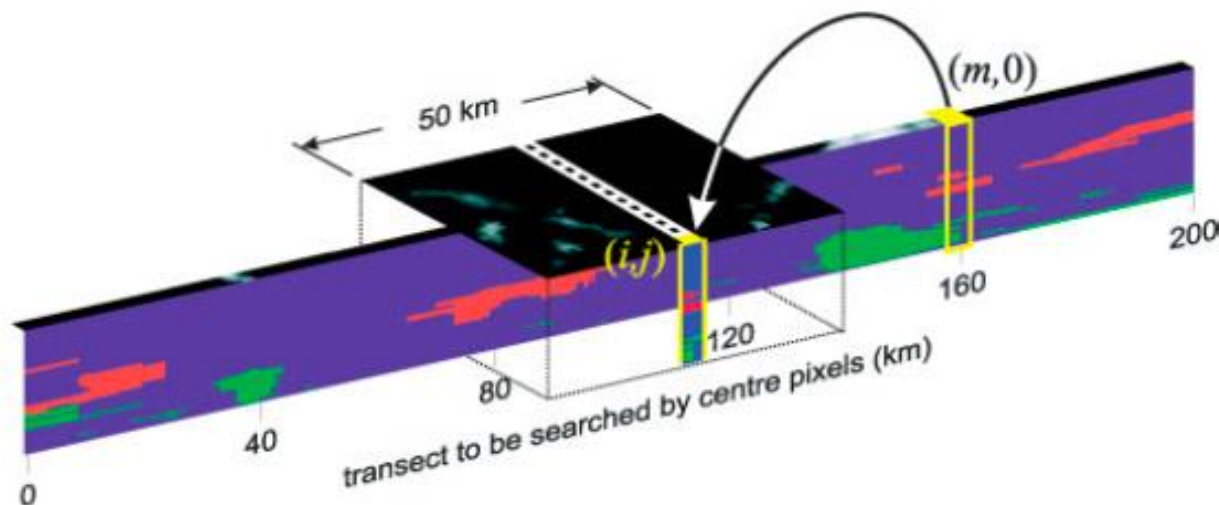

ATLID – 353 nm high spectral resolution lidar

CPR - W-band radar with Doppler capability

MSI – Multispectral imager

BBR – Solar and thermal broadband radiometer (3 views)

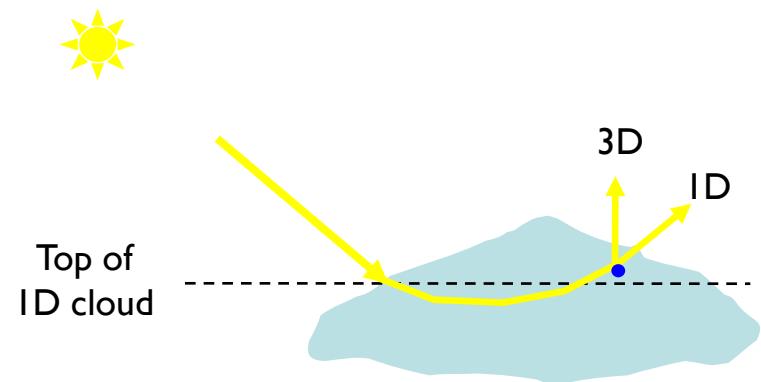

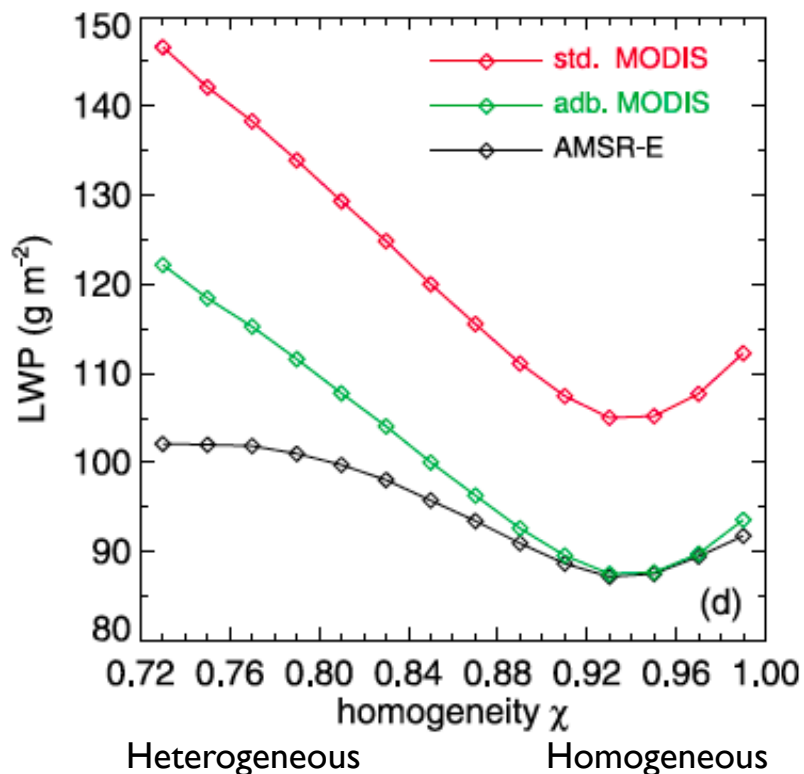

Summary

- Our understanding 3D interactions between sunlight and the atmosphere advanced on many fronts during the SORCE mission.
- Various approaches have been pursued to mitigate the impacts of 3D processes in remote sensing, and even to take advantage 3D radiative processes in lidar probing of thick clouds.
- The EarthCARE mission will be the first to use 3D radiation calculations operationally.

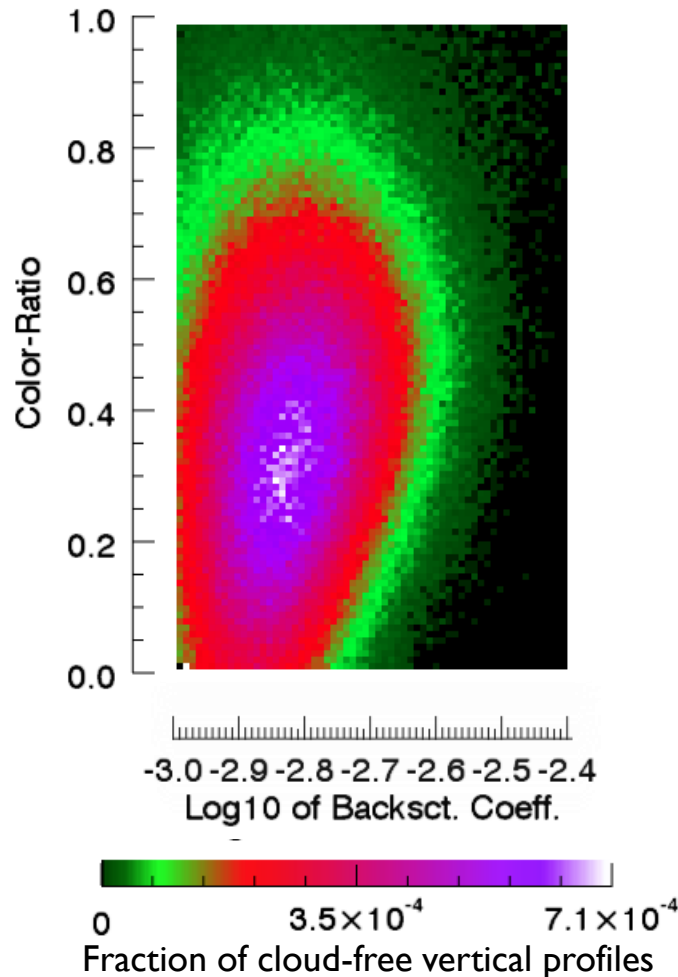

Impacts in cloud remote sensing: water content

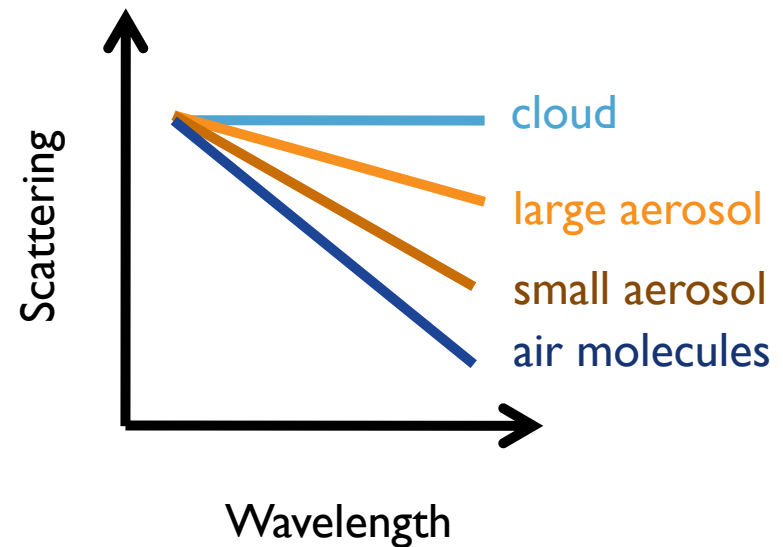

Global annual average for
warm non-precipitating overcast clouds

CALIOP gives information on aerosol OT, size

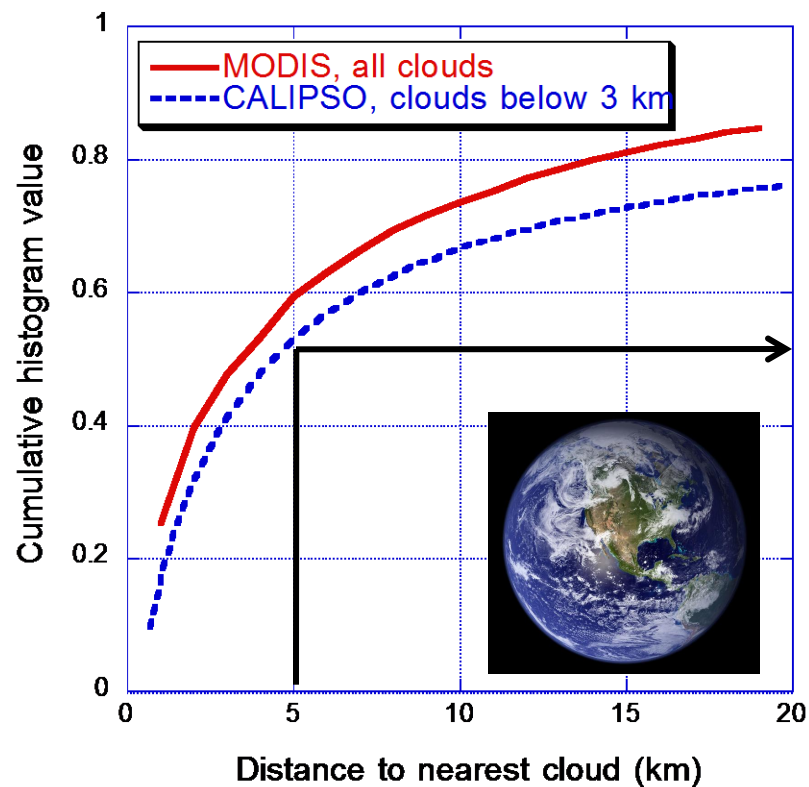

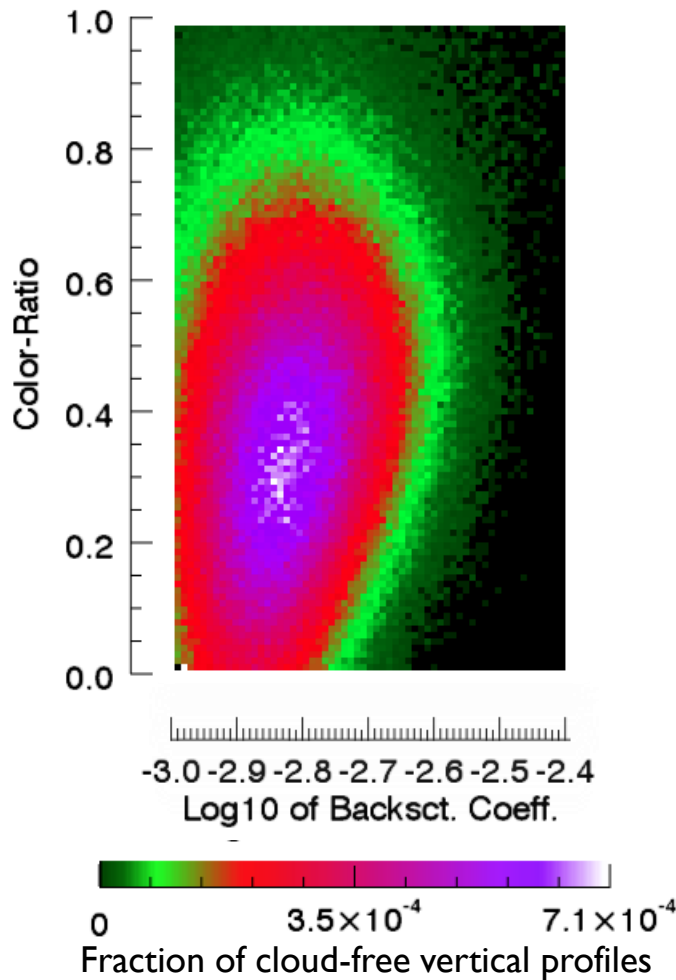

$$\text{Color ratio} = \frac{\text{Backscatter}_{1064 \text{ nm}}}{\text{Backscatter}_{532 \text{ nm}}}$$

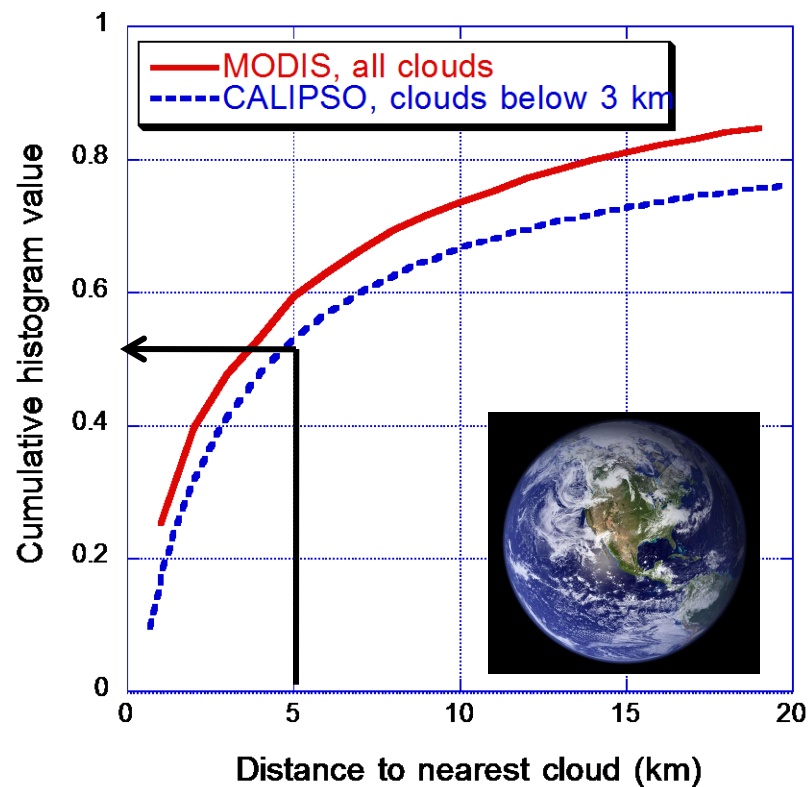

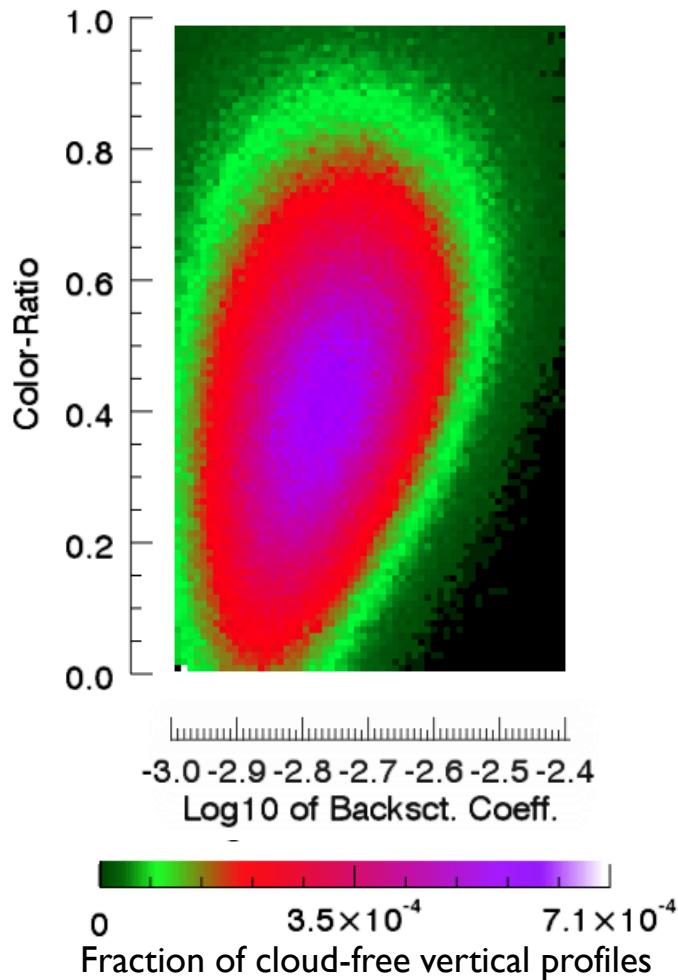

CALIOP histogram far from clouds

Far from clouds (> 5km)

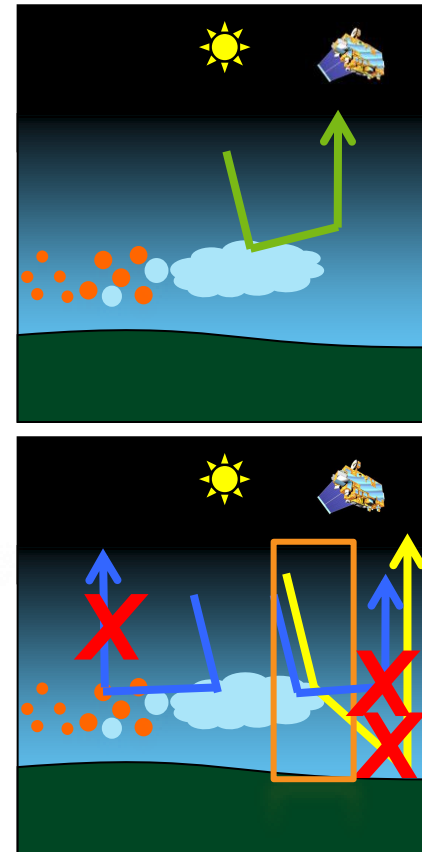

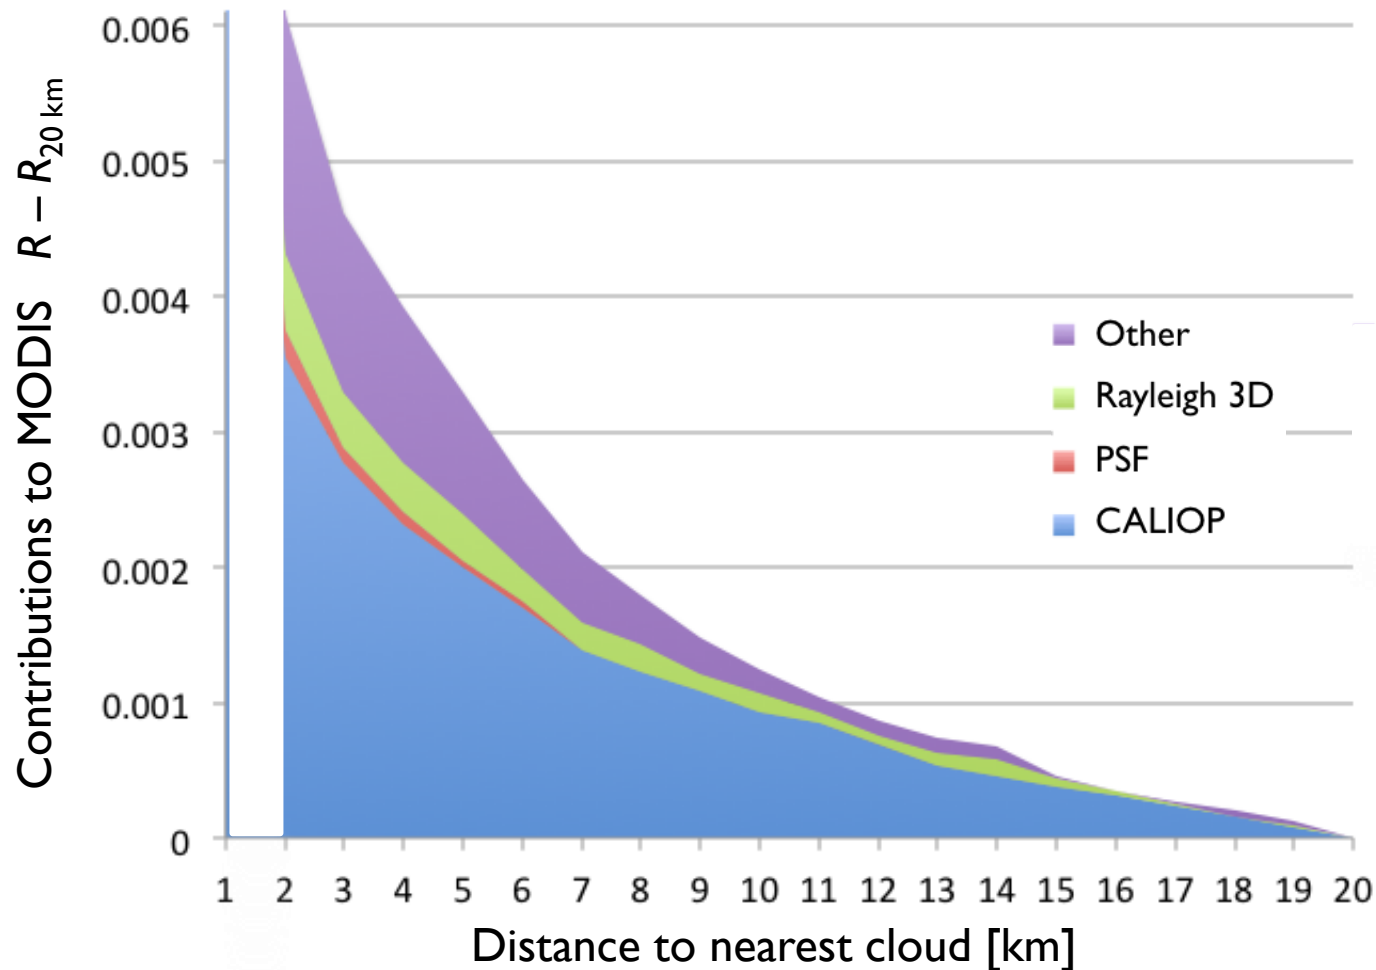

CALIOP histogram near clouds

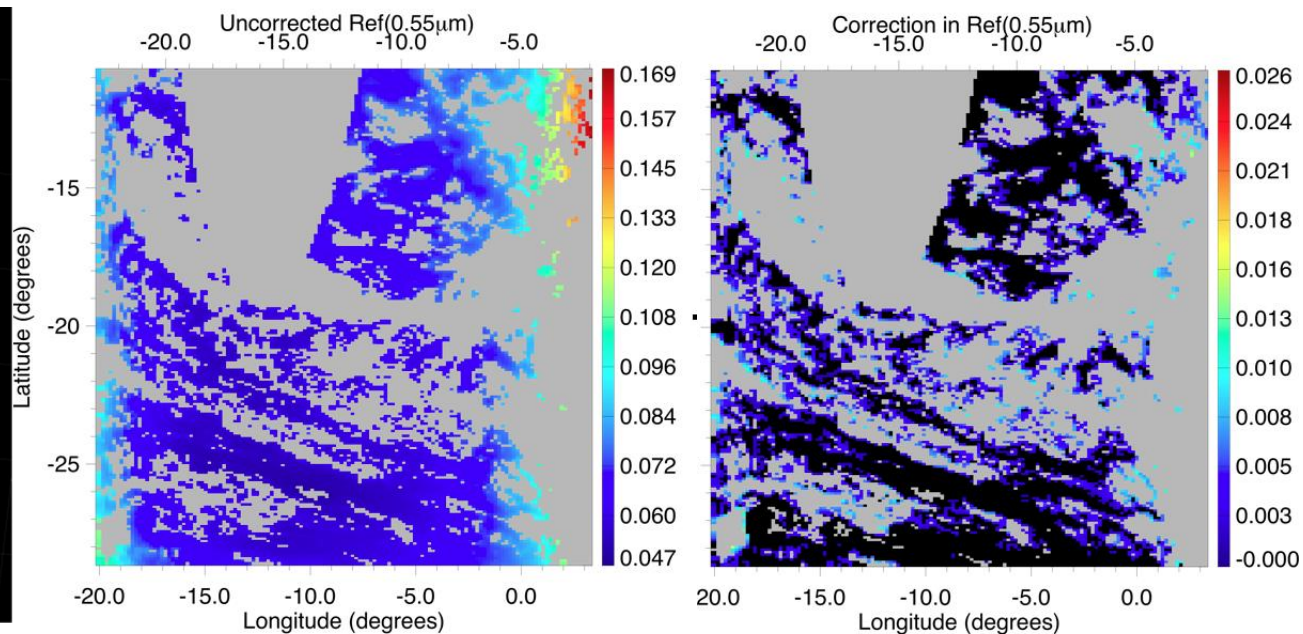

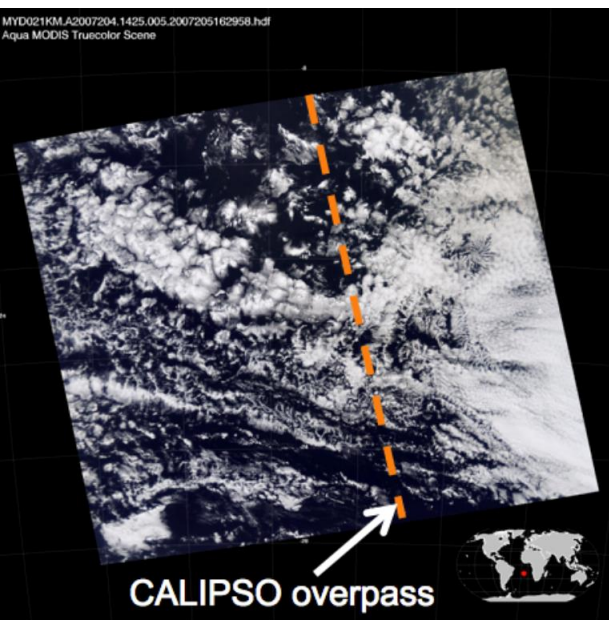

Close to clouds (< 5km)

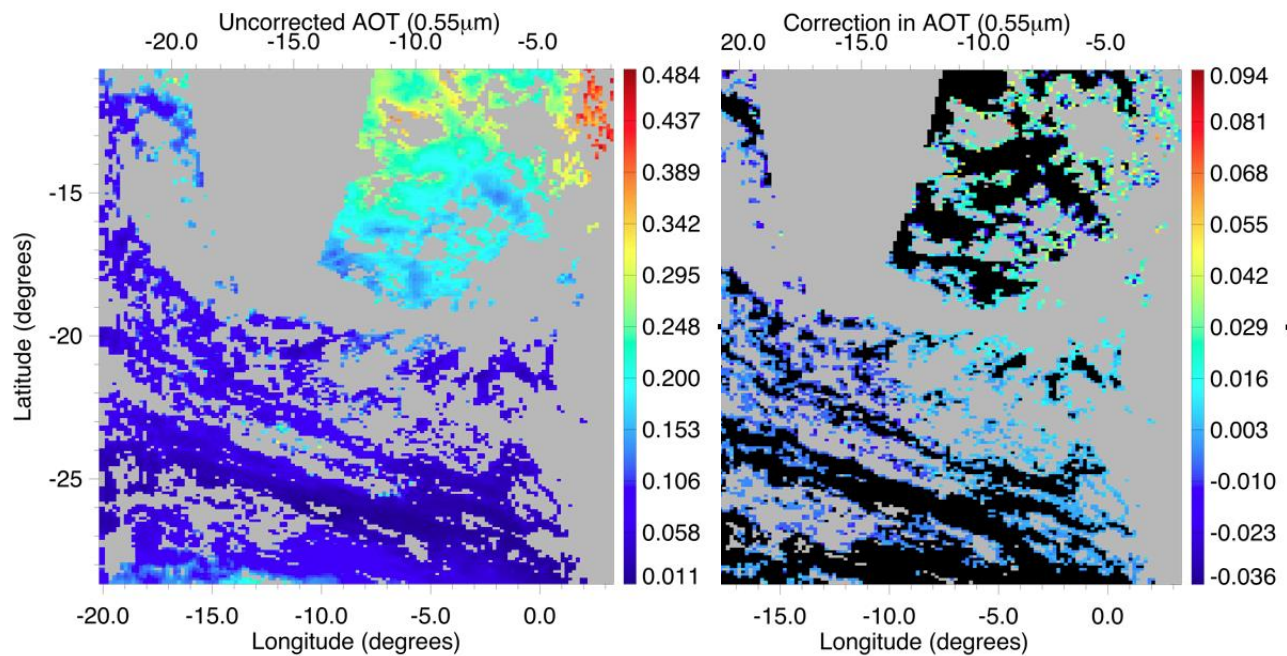

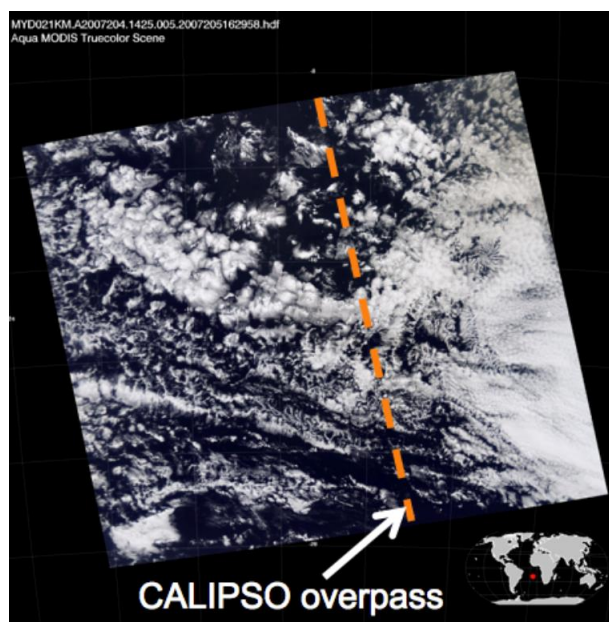

MODIS data vs. simulations of 3D enhancement

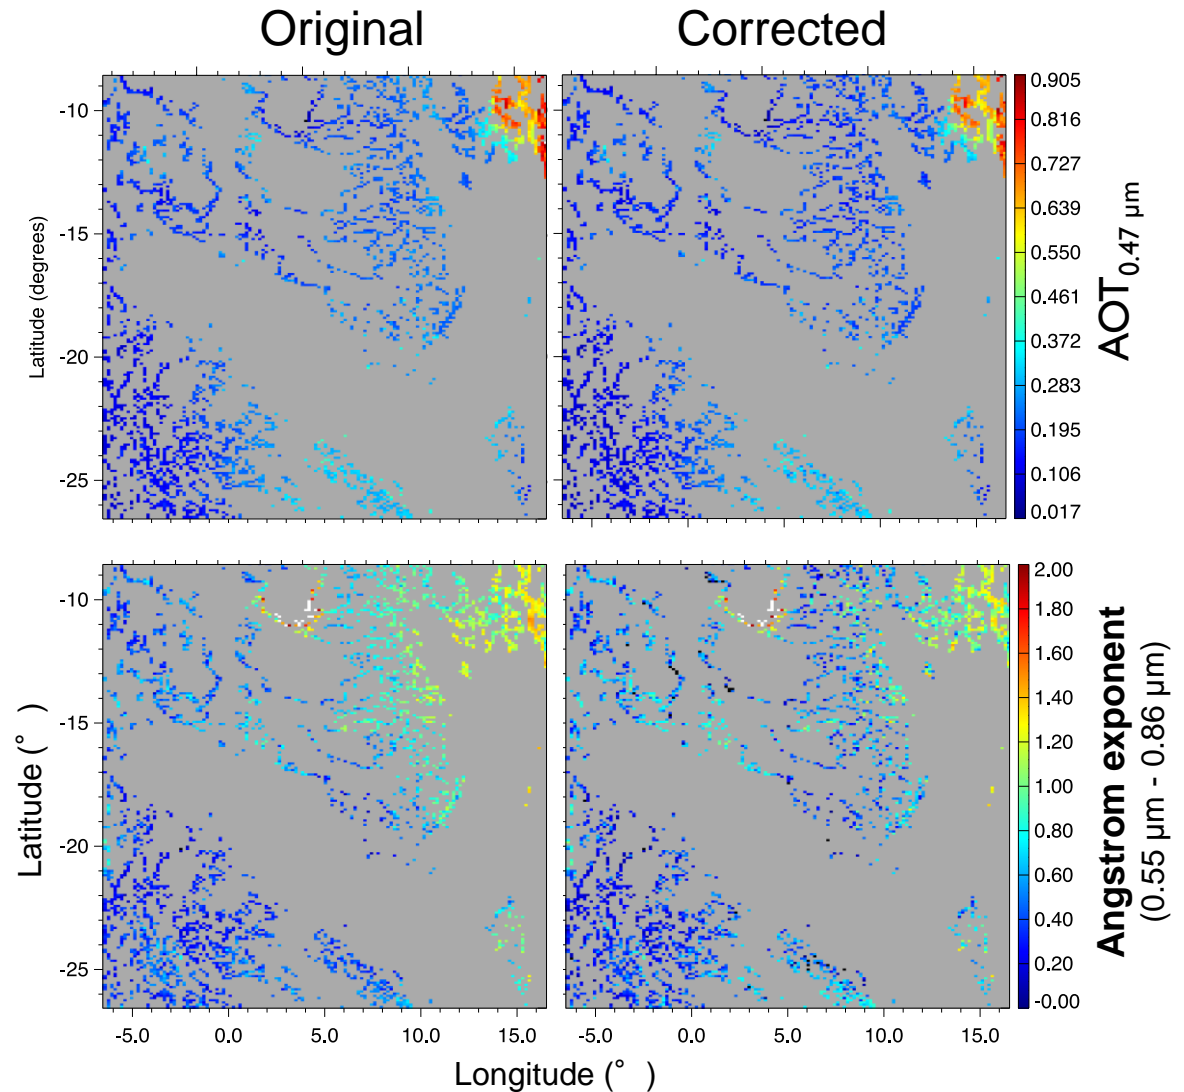

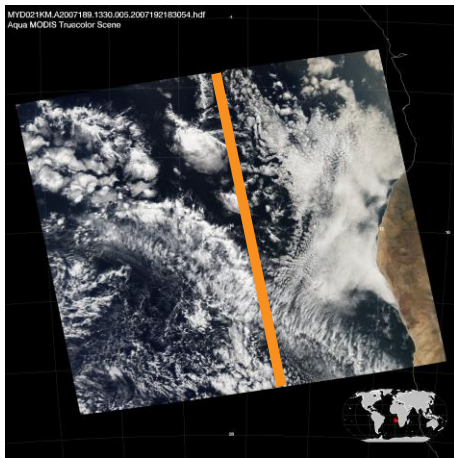

Reflectance corrections for a sample scene

AOT corrections for sample scene

Aerosol retrievals using corrected radiances

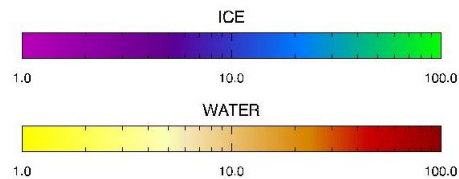

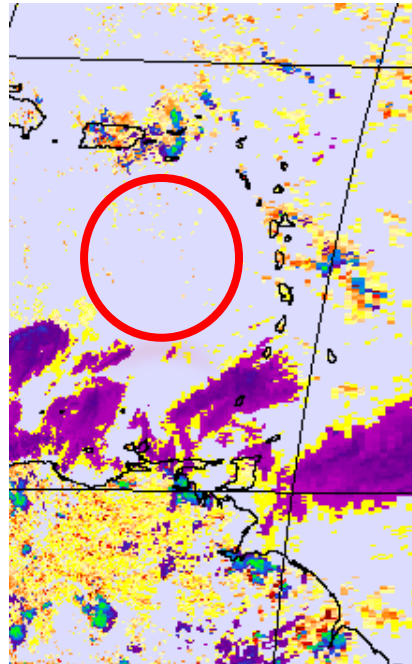

3D effects of Cu not fully present in simulations

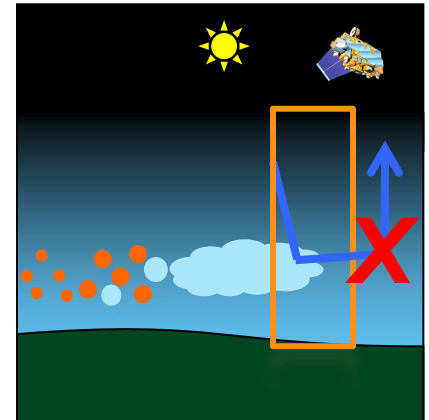

RGB image

Cloud product

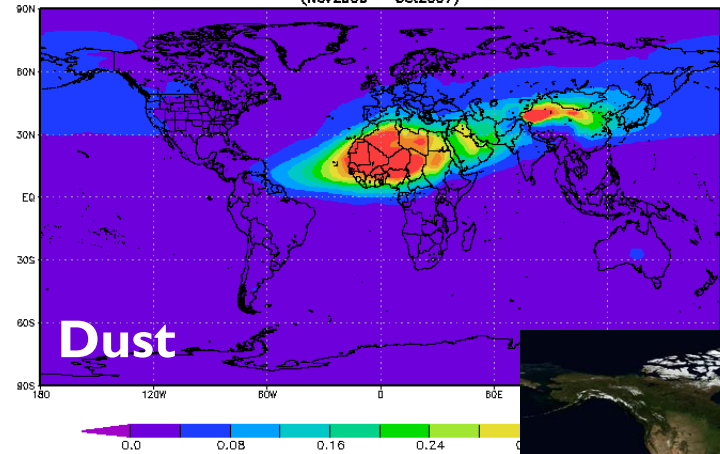

Cloud optical thickness

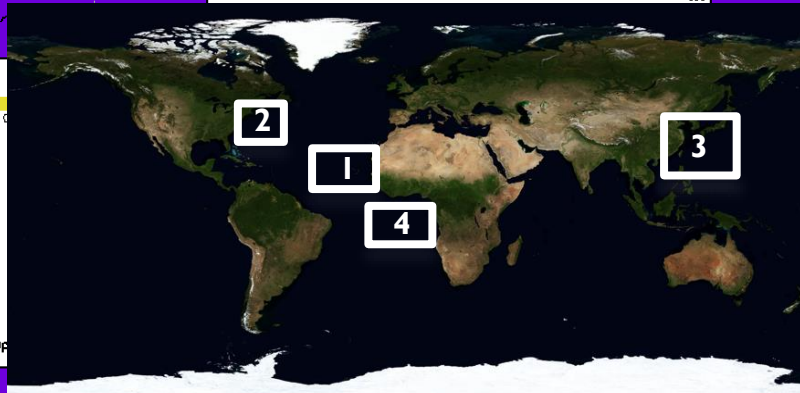

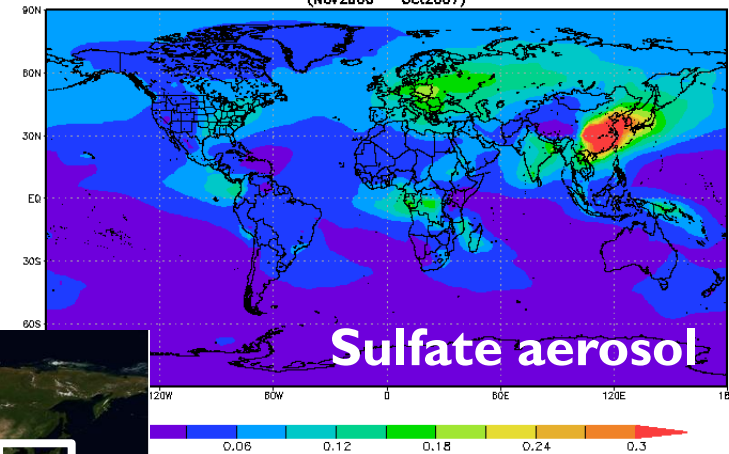

Regions dominated by different aerosols

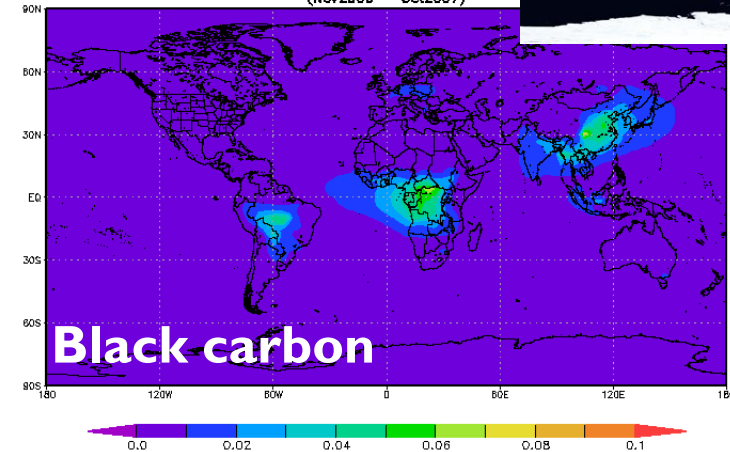

G4P0_1MS_2D_du_aot.006 Dust Aerosol Column Optical Depth (550 nm) [unitless]
(Nov2006 - Oct2007)

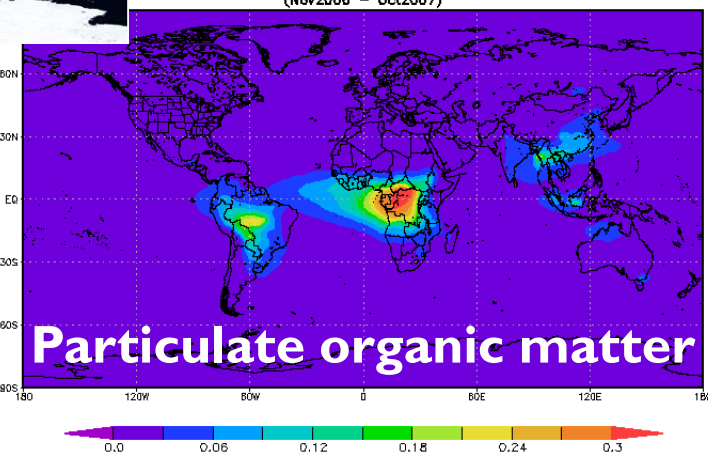

G4P0_1MS_2D_su_aot.006 Sulfate Aerosol Column Optical Depth (550 nm) [unitless]
(Nov2006 - Oct2007)

G4P0_1MS_2D_cc_aot.006 Black Carbon Column Optical Depth (550 nm) [unitless]
(Nov2006 - Oct2007)

G4P0_1MS_2D_po_aot.006 Particulate Organic Matter Column Optical Depth (550 nm) [unitless]
(Nov2006 - Oct2007)

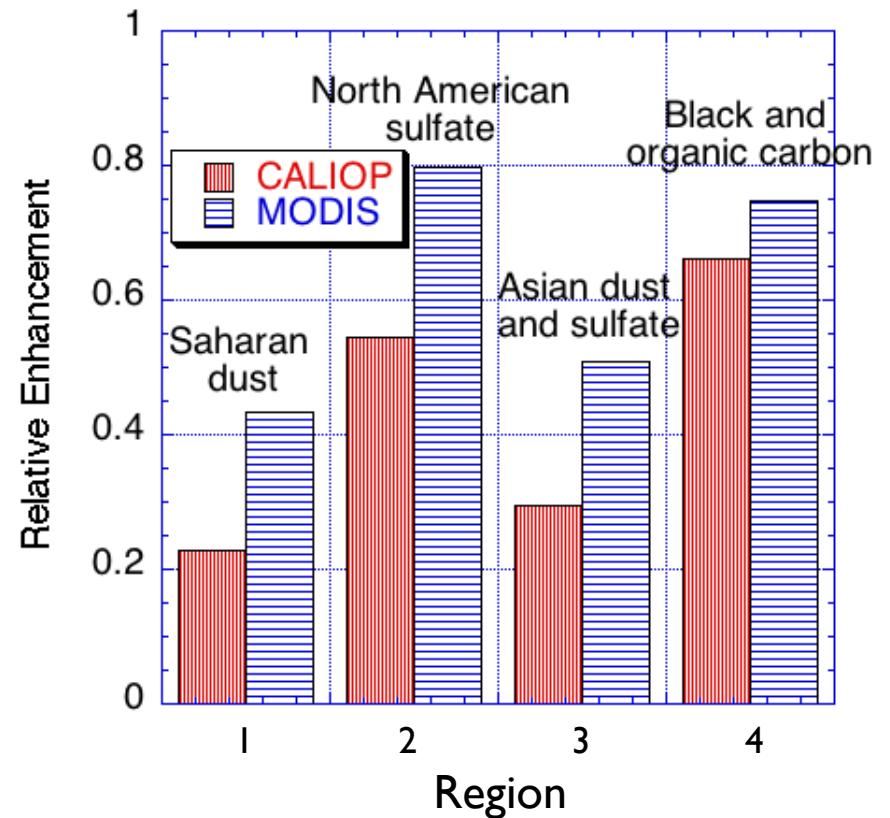

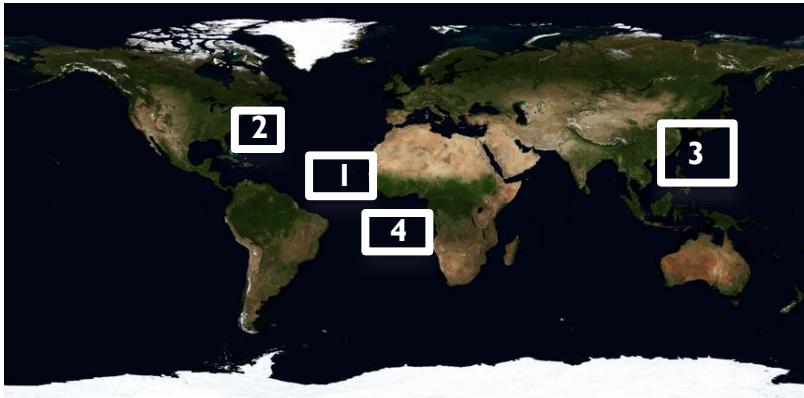

GOCART data
11/06-10/07

Rel. enhancements are different in each region

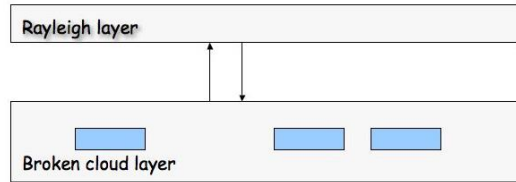

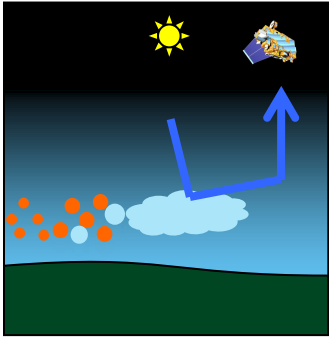

$$\text{Rel. enh.} = \frac{R_{\text{close}}^{\text{particles}} - R_{\text{far}}^{\text{particles}}}{R_{\text{far}}^{\text{particles}}}$$

$R^{\text{particles}}$ obtained by removing:

- Rayleigh scattering
- Surface reflection for MODIS
- Ozone absorption for CALIOP

Correction for 3D effect is being developed

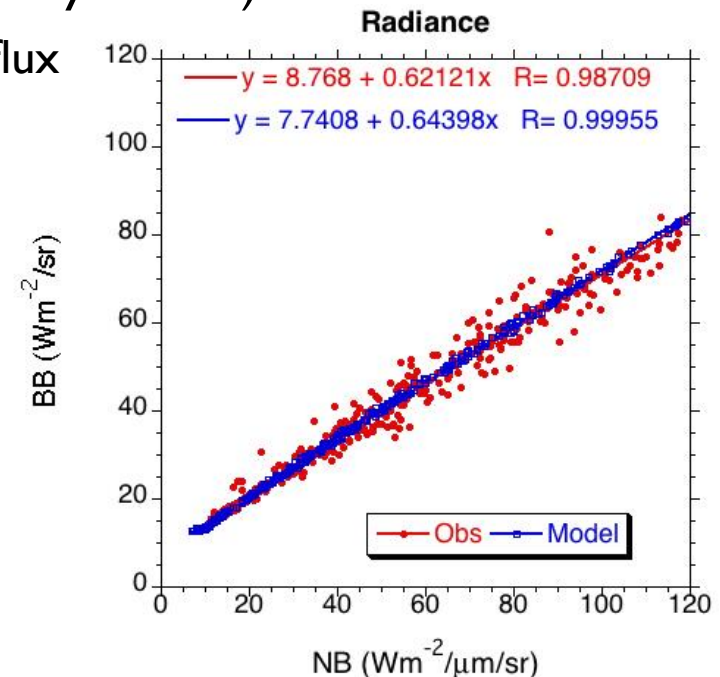

$$R_{corr} = R_{MODIS} - DR$$

$$DR = \frac{a_c T_m(t_m, W_0)}{1 - a_c R_{m,diff}(t_m, W)} [t_{m,diff}(t_m, W) - e^{-\frac{t_m}{m_0}}]$$

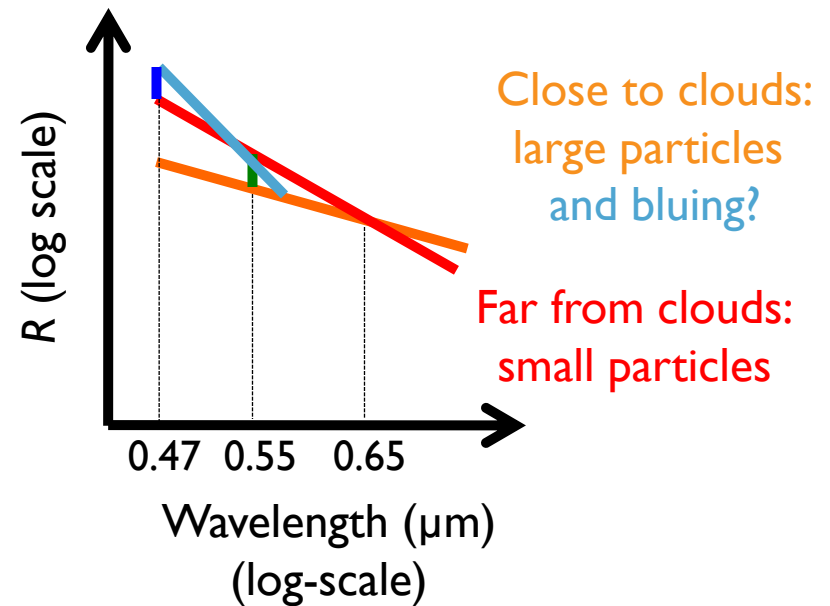

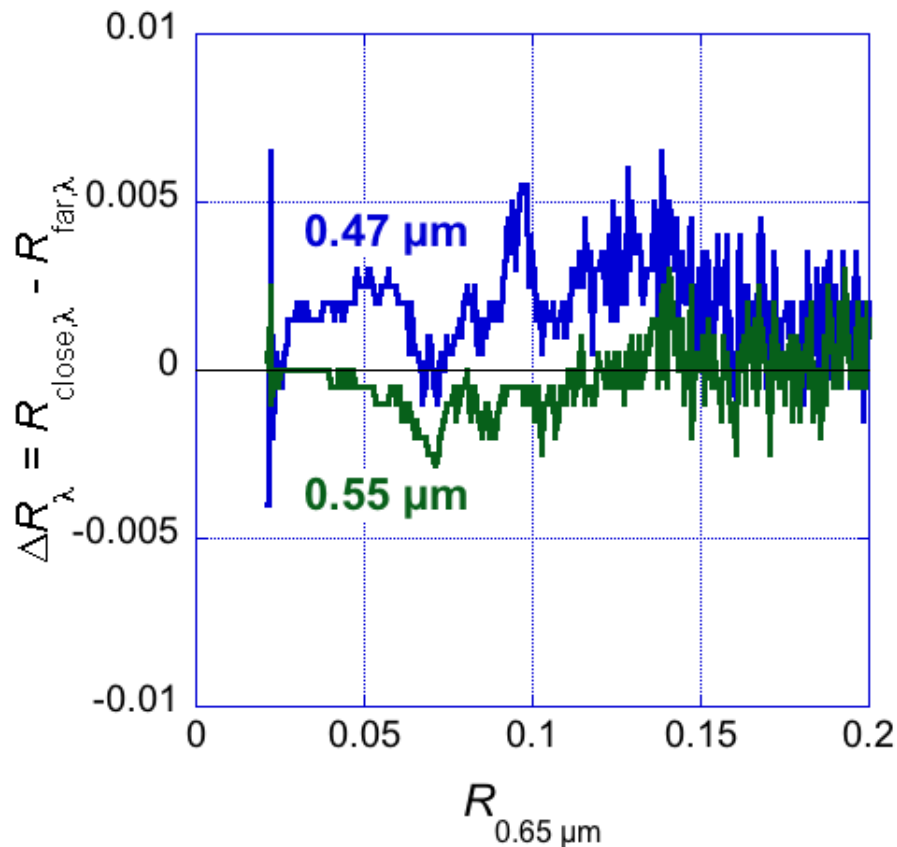

CERES can help get α_c (narrow band flux reflected by clouds):

- Broadband radiance + angular model \rightarrow broadband flux
- Convert to narrowband flux by assuming that

$$\frac{F_{obs}^{NB}}{F_{obs}^{BB}} \gg \frac{F_{model}^{NB}}{F_{model}^{BB}}$$

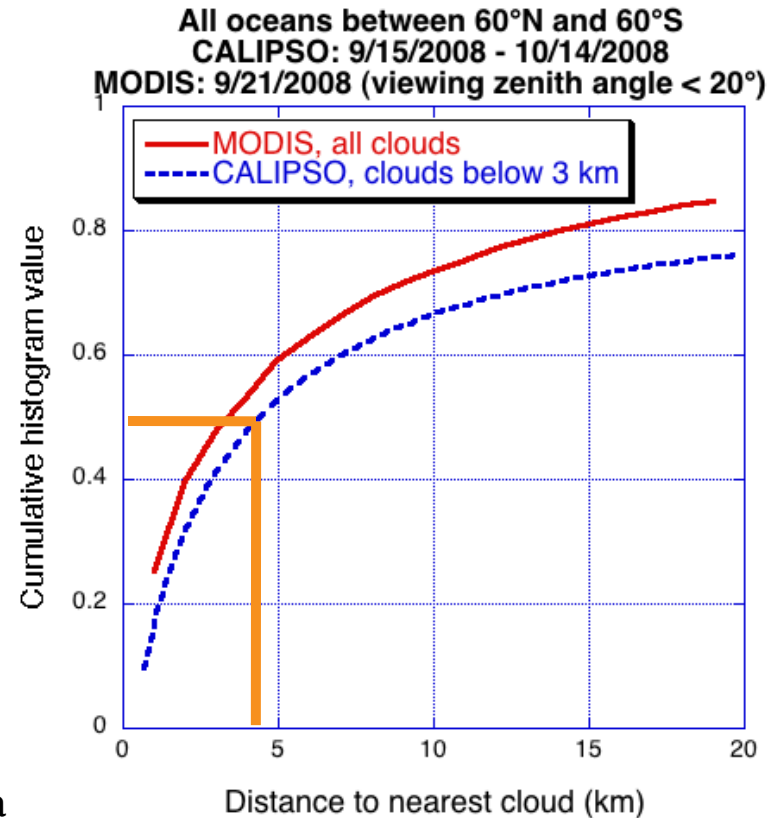

MODIS spectral data consistent with 3D bluing

Aerosol measurements near clouds are important

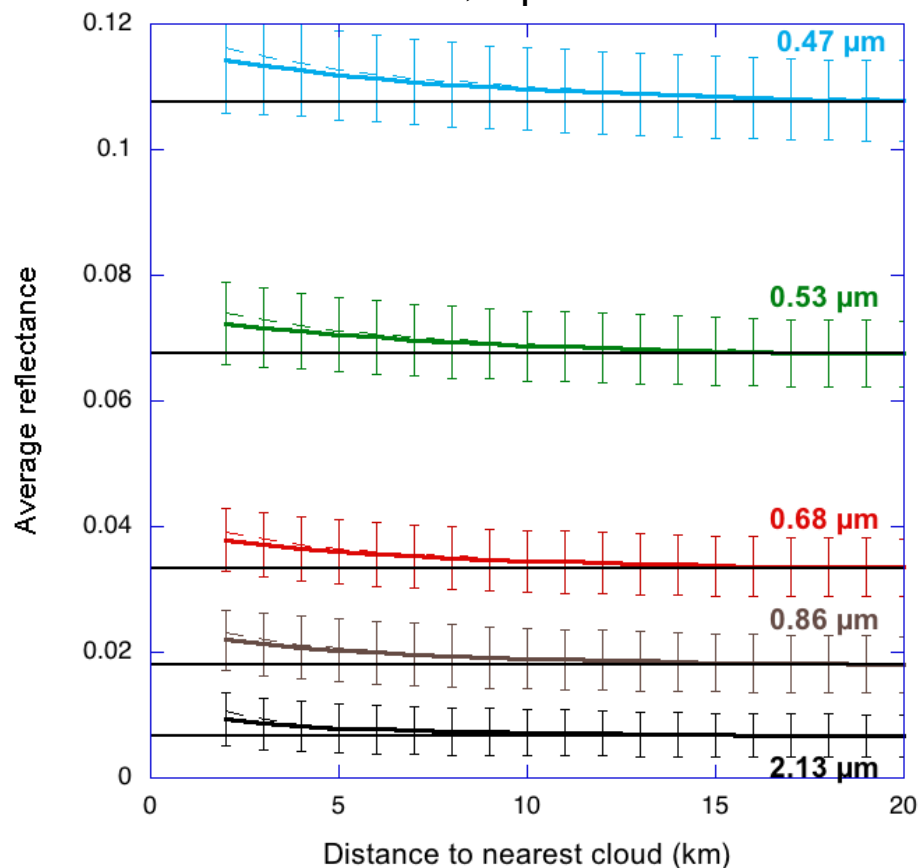

- Aerosol remote sensing near clouds is challenging
- Excluding areas near-cloud risks biases in aerosol data

MODIS reflectances increase near clouds

NE Atlantic Ocean, MODIS Terra
2000-2007, September 14-29

Reflectance increase may come from:

- Aerosol changes (e.g., swelling in humid air)
- Undetected cloud particles
- Instrument imperfections
- 3D radiative effects
