

From Logan Dougherty – June 9, 2015 – Re: messed up milliseconds.

Next is a plot of data from the Voyager 1 and Voyager 2 SSEDR files. The y axis is the Decimal date, and the x axis is the number of milliseconds in the measurement. In the Voyager 1 data, it all makes sense and the data ranges from 0 milliseconds to 999 milliseconds.

However, with the Voyager 2 data, it appears that for a large portion of the text file the value for milliseconds is either 0 or 1000 (which is just 1 second) and is a trivial output. In my program I have rounded it and adjusted the seconds. The error can then propagate through if it is 59 seconds and 1000 milliseconds, so the code currently accounts for that and adjusts the values to propagate through that error. The middle plot is all of the Voyager 2 data, about 15,653 data points. It looks like a black chunk because they alternate between 0 and 1000 frequently. I zoomed in one one range in the 3rd plot to show that it is either 0 or 1000.

From this, it would appear that there is an error in the calculation of the milliseconds, and hopefully not seconds or minutes, from the original code from MIT. I'll attach the two data files as well. Timestamps for milliseconds can be found in both the 6th column (trajectory timestamps) and the 39th column (pointing timestamps).

- Logan
